What are the dos and don'ts when moving a fridge from one place to another, I mean over a long distance? That's what we will be looking at here. Mind you; this is a general tip on how to transport a refrigerator. 1. Unplug the fridge Hey, safety first! Never do anything unless you have your fridge unplugged. In simple terms, make sure it is not connected to a power source before moving the refrigerator out of position. After unplugging your appliance, make sure you fold the plug properly, so it doesn't drag on when transporting it. You also don't want the fridge plug to get damaged, so make sure it is neatly secured. 2. Keep the fridge empty Get the food and other items out of the refrigerator. Allowing them to remain would not only add more weight to the fridge. Your stored foods would get spoiled before you reach your final destination. If you have solid objects like bottles and cans in the fridge, take them off too. Such items can get broken or damage the internal part of the refrigerator. Unfortunately, most people don't see this as a big deal. But if you want to transport your fridge safely, then you should spend time to unpack the food and any item that's in there. In a nutshell, ensure it is empty. 3. Consider defrosting your fridge Another critical step is to defrost. Just unplug the refrigerator and let it stay that way for hours until there is no frost left. But you need time to make this happen; it will undoubtedly take some time to get the fridge ready to have it moved to another location. So, if you are doing the moving the next day, unplug the fridge today and let it remain that way throughout the day. And once it is completely defrosted, make sure you clean up the leftovers (water, food particles, and others stuff) from the inside of the fridge to prevent water from getting into places that it shouldn't. 4. Move the shelves out Hey, get everything out of the damn fridge! I mean every single thing. Sorry, I have to be serious about this because any object left in the refrigerator can cause severe damages to the interior of the appliance. And you don't want that to happen. While in transit, the shelves could move and damage your fridge. So make sure you clear them out. But if you don't feel like taking them off, use tape to secure the shelves firmly in their respective positions. 5. Keep the door shut Wait a minute, how should you go about this? It's not like you can stand next to your fridge while in transit anyway. Well, the answer is to use tape. Get a tape and secure the door firmly in one place, I mean closed. That way, you can prevent the door from flapping while the fridge is in transit. Wise stuff! 6. Load the fridge Now is the time to seek help. Trust me; you are going to need a helping hand, probably your next door neighbor's help. You see, it's easy to think you can lift the fridge yourself. After all, it's empty. But don't! I mean don't do this all alone. The thing is you might accidentally drop the fridge on the ground, and this could be disastrous. 7. Secure the refrigerator Another step you can take while transporting your fridge is to secure it. You can place it at the center of the truck or van, and cover it up with a blanket. The thing is fridges are not only heavy but delicate. And as a result, when they come in contact with the truck or van, it could dent the outer surface of the fridge. So, place a sizeable blanket over your fridge to help avoid dings and dents that could deface your appliance. 8. Consider the position How you position a fridge while transporting it from one place to another, matters. And keep in mind that some refrigerators cannot be carried while laying down on their sides. So check appropriately before progressing with your plan to lay your fridge by its side. But if you can, it would be advisable to keep the fridge in a vertical position throughout the journey. I hope this video will help you to do this task perfectly. Conclusion Now can you transport a refrigerator laying down? I hope with the explanations given that you now have a better understanding and idea of the right answer. The thing is you can transport a fridge that is laying down, but not all of them though. For the ones you can transport this way, you must ensure that the door is locked correctly and that other objects around while in transit don't dent the body of the fridge, too.
